

Storage & Handling:

The originally packed Wilsonart® Backsplash sheets should not be stored outside nor be exposed to extreme variations of weather and/or temperature. Storing under conditions with substantial variation of temperature and humidity, flat shape distortion (corrugation) of the sheet can happen, even when stored flat and stacked. This product must be stored in a climate controlled environment.

Protective clear film protects the material against debris, mechanical load and scratches. It is recommended to leave the protective film in place until final installation process. This will help to prevent scratching or other surface damage during storage or transit.

The protective clear film on the Wilsonart® Backsplash should be peeled back to check for damage or discrepancies in color when necessary, then replaced to provide protection during installation.

Color discrepancies should be checked from the face side only as the appearance of “patching” on the rear face is normal.

Packing Instructions:

Wilsonart® Backsplash material is packed using flat and rigid skids/pallets. Cardboard is used as added protection between the Backsplash sheets. Banding boards are added and then secured with plastic strapping.

Recommend flat pack crates or pallets/skids with 30 sheet maximum per pallet/skids. Pallet/skids storage should be in upright racks or bulk storage on the floor.
